## MAIN FEATURES

NOTE: The appendix to this issue contains a table for May 1986 which compares employment data for South Australia classified according to the Classification and Classified List of Occupations (CCL0) and its replacement from August 1986, the Australian Standard Classification of Occupations (ASCO).

### SOUTH AUSTRALIA

- Total employment grew by 13,400 (2.3 per cent) over the year to November 1986, including an increase of 12,800 (2.6 per cent) in the number of wage and salary earners. The total increase was evenly divided between full-time and part-time employment growth (each up by 6,700).
- Married female employment grew by 11,700 (8.2 per cent) over the year. This was reflected in an increase in that group's labour force participation rate, from 46.8 per cent in November 1985 to a record level of 48.8 per cent in November 1986.
- Total unemployment peaked at 63,200 in September 1986, but had fallen back to 54,400 by November 1986, to be 2,300 (4.4 per cent) higher than the November 1985 level of 52,100. This compares with an increase of 15,700 (2.4 per cent) in the size of the labour force over the same period.

### REGIONS OF SOUTH AUSTRALIA

- Total employment grew by 14,200 (2.4 per cent) between August and November of 1986, including growth of 4,300 (3.4 per cent) in the Para and North Eastern Statistical Subdivisions and 3,400 (2.9 per cent) in the Southern Statistical Subdivision.
- Employment in Manufacturing increased by 6,000 (6.3 per cent) over the quarter, including increases of 3,500 (13.6 per cent) in the Para and North Eastern Statistical Subdivisions and 2,600 (14.4 per cent) in the Western Statistical Subdivision. These increases are roughly comparable to those which occurred between August and November of 1985.
- Employment in Community Services showed growth of 6,400 (6.8 per cent) in the Adelaide Statistical Division over the quarter. This was offset by a fall of 2,000 (8.5 per cent) in the 'Balance of South Australia'. Almost half of the metropolitan increase in Community Services occurred in the Southern Statistical Subdivision, where growth of 3,000 (10.3 per cent) was recorded. This compares with growth in that area of 2,700 (11.0 per cent) during the same quarter of 1985, and 2,600 (9.8 per cent) between May and August of 1986.

## EXPLANATORY NOTES

### INTRODUCTION

This publication contains estimates of the civilian labour force derived from the labour force survey part of the monthly population survey, including estimates for regions of South Australia.

2. Preliminary survey results are published in advance of this more detailed publication in The Labour Force, Australia, Preliminary (6202.0).

3. Although emphasis in the population survey is placed on the regular collection of data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are published and are available on request. A list of publications on labour force and related topics is given in The Labour Force, Australia (6203.0).

### THE POPULATION SURVEY

4. The population survey is based on a multi-stage area sample of private dwellings (about 5,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.), and covers about one per cent of the population of South Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. Because of operational problems arising from the Christmas and New Year holidays, interviews for the December 1985 survey commenced on Monday 2 December, and for the January 1986 survey on Monday 13 January. The information obtained relates to the week before the interview week (i.e. the survey week).

### SCOPE

5. The labour force survey includes all persons aged 15 and over except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- (c) overseas residents in Australia; and
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia.

### DEFINITIONS

6. The labour force category to which a person is assigned depends on his actual activity (i.e. whether working, looking for work, etc.) during

the survey week. The following definitions, which conform closely to the international standard definitions specified by the International Labour Organisation (ILO), relate only to those persons within the scope of the survey.

7. Employed persons comprise all those aged 15 and over who, during the survey week:

- (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (including employees, employers and self-employed persons); or
- (b) worked for one hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or
- (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- (d) were employers, self-employed persons or unpaid family helpers who had a job, business or farm, but were not at work.

8. Full-time workers are those who usually work 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the survey week. Part-time workers are those who usually work less than 35 hours a week and who did so during the survey week.

9. Hours of work. The figures of aggregate hours and of average hours refer to actual hours worked during the survey week, not hours paid for. The figures may be affected by public holidays, leave, absenteeism; temporary absence from work due to sickness, injury, accident and industrial disputes; and stoppages of work due to bad weather, plant breakdown, etc. When hours of work are recorded, fractions of an hour are disregarded and this results in slightly lower figures than would be the case if actual time worked was recorded.

10. Unemployed persons are those aged 15 and over who were not employed during the survey week, and

- (a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the survey week and:

- (i) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or

- (ii) were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then;

or (b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

11. Actively looking for work includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency, advertising or tendering for work; and contacting friends or relatives.

12. The unemployment rate for any group is the number unemployed expressed as a percentage of the labour force (i.e. employed plus unemployed) in the same group.

13. Duration of unemployment is the period from the time the person began looking for work or was laid off to the end of the survey week. Thus the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full-time for two weeks or more to the end of the survey week. Periods of unemployment are recorded in complete weeks and this results in a slight understatement of duration. Average (mean) duration is the duration obtained by dividing the aggregate number of weeks a group has been unemployed by the number of persons in that group. Median duration is the duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median, and the other, persons whose duration is below it.

14. The labour force comprises all persons who, during the survey week, were employed or unemployed, as defined above.

15. Persons not in the labour force are those who, during the survey week, were not in the categories employed or unemployed, as defined

above. They include persons who were keeping house (unpaid), attending an educational institution (school, university, etc.), retired, voluntarily inactive, permanently unable to work, inmates of institutions (hospitals, gaols, sanatoria, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation.

16. The labour force participation rate for any group is the civilian labour force expressed as a percentage of the civilian population aged 15 and over in the same group. Because it is not practicable to ascertain the birthplace of persons in institutions (who are classified as not in the labour force), labour force participation rates for persons classified by birthplace are calculated by using population estimates which exclude those in institutions.

17. Persons classified by labour force status are classified according to whether or not they are in the labour force. Persons in the labour force classified by employment status are classified according to whether they are employed or unemployed. This publication includes a table showing estimates of employed persons, obtained from the labour force survey, classified by status of worker; i.e. whether they were employers, self-employed persons, wage and salary earners (employees), or unpaid family helpers.

18. Industry is classified according to the Australian Standard Industrial Classification (ASIC) 1983 (1201.0 and 1202.0) and occupation according to the Australian Standard Classification of Occupations (ASCO) 1986 (1221.0 and 1222.0).

19. Occupational data classified to ASCO was introduced for the August 1986 survey, replacing the Classification and Classified List of Occupations (CCLO), Revised November 1980, used in previous surveys. The new classification relies on the level and specialisation of skill required to satisfactorily perform primary tasks as its classificatory variable and is therefore significantly different from the previous classification.

20. A matrix of the two classifications at the broadest classification level (Major Group) has been included in the Appendix to this publication. The estimates contained in the matrix have been derived from the May 1986 Labour Force Survey. The responses to questions on the occupations of employed persons were coded to both ASCO and CCLO classifications and the matrix was produced by cross-classifying ASCO Major Groups by CCLO Major Groups. A similar matrix for Australia was published in the August 1986 issue of The Labour Force, Australia (6203.0). The following additional tables for Australia are available upon request:

- (a) ASCO by CCLO (Major Groups) by sex;
- (b) ASCO by CCLO (Major Groups) by age; and
- (c) ASCO by CCLO (Minor Groups).

21. In the labour force survey, persons are classified as married or not married. Marital status is determined from information supplied by the respondent about the individual, and, where the person was reported as being married, about the living arrangements of persons usually resident in the household. Marital status does not therefore necessarily reflect legal status. Persons are classified as married if they are reported as being married (including de facto) and their spouse was a usual resident of the household at the time of the survey. The not-married category includes persons who have never married, or are separated, widowed or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household. Persons who live in a de facto relationship but do not volunteer this information when asked whether they are married are classified as not married. For discontinuities in estimates of marital status, see paragraphs 32 and 33.

#### REGIONS OF SOUTH AUSTRALIA

22. The regions used in this publication are standard ABS Statistical Divisions and Subdivisions (see maps) or combinations of these, and, as such, do not necessarily correspond with regions adopted by other government authorities. These regions have been formulated following detailed discussions with users, taking into consideration State geography, the need for consistency with other statistical collections, sample size and the requirement to produce a reasonable range of reliable data on both employment and unemployment for each region. While further unpublished details may be available for the regions adopted in this publication, estimates for different regions cannot be provided.

#### POPULATION BENCHMARKS

23. Labour force survey estimates of persons employed, unemployed and not in the labour force shown in this publication for South Australia, Adelaide Statistical Division and Balance of South Australia are calculated in such a way as to add up to the independently estimated distribution of the population aged 15 and over by age and sex. This procedure compensates for underenumeration in the survey, and leads to more reliable estimates. The independent population statistics (benchmarks) are the latest available estimates at the time the labour force survey is conducted, but they usually differ from the official population estimates subsequently published in Australian Demographic Statistics (3101.0) because they are necessarily derived from incomplete information about population changes.

24. Regular estimates of the population at the regional level are not available, and so State benchmarks have been used to produce regional estimates. For this reason, estimates of the civilian population aged 15 years and over are not made available at the regional level.

#### REVISION OF SERIES

25. Survey estimates are revised after each census of population and housing, and when population estimation bases are reviewed. Survey estimates back to February 1978 have been recalculated to conform to revised population estimates which take account of results of the 1981 Census. An assessment of the effect of the revisions on labour force estimates is contained in an appendix to The Labour Force, Australia, February 1984 (6203.0).

26. Following the change in official population estimates to a place of usual residence basis after the 1981 Census, the population benchmarks used in the estimation of labour force survey data are compiled according to place of usual residence. For an explanation of the new conceptual basis of population estimates see Population Estimates: An Outline of the New Conceptual Basis of ABS Population Estimates (3216.0). To co-ordinate with the new benchmarks, the labour force survey questionnaire was changed in October 1982 to enable identification of each respondent's place of usual residence. Revised estimates for October 1982 onwards are thus wholly according to place of usual residence. For periods before October 1982, the estimates are based on a combination of place of enumeration and place of usual residence.

27. Until February 1978, surveys were conducted in February, May, August and November each year from 1964. From February 1978 the survey has been conducted on a monthly basis.

28. The questionnaires used in the survey for the collection of labour force data have been revised a number of times. Details of previous changes made to the questionnaires have been published in Information Paper: Questionnaires used in the Labour Force Survey (6232.0) in March 1978, December 1981 and August 1984.

29. A revised questionnaire was also introduced for the April 1986 survey. Following the introduction of this questionnaire, the definition of employed persons has been extended to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. unpaid family helpers). This aligns the Australian labour force concepts with a set of changed international definitions adopted by the International Labour Office at the 13th Conference of Labour Statisticians in October 1982.

30. Previously, such persons who worked 1 to 14 hours or who had such a job but were not at work were defined as either unemployed or not in the labour force, depending on whether they were actively looking for work. Details of this change in definition, together with other changes made to the questionnaire, are contained in Information Paper: Questionnaires used in the Labour Force Survey (6232.0) released in June 1986.

#### COMPARABILITY OF SERIES

31. As noted in paragraphs 25 and 26, estimates back to February 1978 have been revised to conform to revised population estimates. The revised estimates are not strictly comparable with estimates for periods before February 1978.

32. Paragraph 21 outlines the definition of marital status now used in the labour force survey. In conjunction with the revision of estimates back to February 1978 to conform to revised population estimates, a revision to take account of the new definition of marital status was also applied. Consequently, estimates of marital status contained in this issue are not comparable with estimates published before the February 1984 issue, which classified as married all respondents who reported that they were married or separated. The revision to the marital status classification was undertaken in two parts. Firstly, for all surveys from February 1978, persons who reported that they were separated, were reclassified as not married. Secondly, from June 1983 onwards, in addition to including persons reported as separated, the not-married category includes persons who although reported as married, did not, at the time of the survey, have a spouse who was a usual resident of the household.

33. Before October 1982, respondents who stated they were living in a de facto arrangement were asked how they would describe their marital status on a Population Census schedule and the answer was recorded. From October 1982 these respondents were coded as married. This may have resulted in some discontinuity between September and October 1982 in series classified according to marital status.

34. Comparability with estimates produced from the quarterly survey of employment and earnings is affected by the use of a different survey methodology and definitions. The labour force survey provides estimates of people in jobs whereas the survey of employment and earnings provides an estimate of the number of jobs held by people. A more detailed description of the differences between these two series is provided in Information Paper: Comparison of Employment Estimates from the Labour Force Survey and the Survey of Employment and Earnings (6263.0).

## SURVEY SAMPLE

35. For detailed information on sample design and selection see the Technical Note in The Labour Force, Australia, 1978 (6204.0).

36. The population survey sample is reselected every five years to allow data from the latest census of population and housing to be used to improve the efficiency of the population survey sample design. The latest reselection, which used data from the 1981 Census, was introduced for the October 1982 survey.

## RELIABILITY OF THE ESTIMATES

37. Estimates in this publication are subject to two sources of error:

(a) sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings, they, and the movements derived from them, may differ from the figures that would have been produced if all dwellings had been included in the survey. As noted in paragraph 24 above, the use of benchmarks in the compilation of regional estimates has not been possible. For this reason users should note that regional estimates may be more volatile than corresponding State estimates and therefore they should not be regarded as reliable indicators of short term (monthly) movements. More information on this topic is given in the Technical Notes at the end of this publication.

(b) non-sampling error: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

## DIFFERENCES BETWEEN POPULATION CENSUS AND POPULATION SURVEY ESTIMATES

38. The results of the 1981 Census of Population and Housing show that labour force figures derived from the census differ from estimates derived from the labour force surveys.

39. The broad concepts underlying the measures of the labour force and its components, employment and unemployment, are similar in the census and the survey. However there are considerable differences in both the collection methodology adopted (including the detailed questions asked)

and estimation procedures. Factors contributing to differences in estimates include: under-enumeration in the population census for which census labour force estimates have not been adjusted; the use in the labour force survey of population benchmarks derived from incomplete information about population change (see paragraph 23); the inclusion of permanent defence forces in census estimates; the personal interview approach adopted in the survey as opposed to self-enumeration of census schedules; differing questions used to determine labour force characteristics (particularly the identification of unemployed persons); and differing methods of adjustment for non-response to the survey or census.

40. The labour force survey provides detailed and up-to-date estimates of employment and unemployment for Australia, States and the larger regions, whereas the census of population and housing provides counts for small areas but in less detail than is available from the survey.

41. These considerations should be borne in mind if comparisons are made between population census and labour force survey estimates.

## UNPUBLISHED STATISTICS

42. Other unpublished data from the labour force surveys, including some broad cross-classifications of regional data (by age and marital status) may be available upon request.

## RELATED PUBLICATIONS

43. Users may also wish to refer to the following publications which are available on request:

(a) The number unemployed in each group as a percentage of the labour force in the same group.

(b) A revised definition of employed persons applies from April 1986. See Explanatory Notes, paragraphs 28 to 30.

## TECHNICAL NOTES

### ESTIMATION PROCEDURE

The labour force estimates are derived from the monthly population survey by use of a complex ratio estimation procedure. This procedure ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

### RELIABILITY OF THE ESTIMATES

2. Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. For an explanation of non-sampling error see paragraph 12. The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, the estimates, and the movements derived from them, are subject to sampling variability; that is, they may differ from the figures that would have been obtained if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included and about nineteen chances in twenty that the difference will be less than two standard errors. The standard error can also be expressed as a percentage of the estimate, and this is known as the relative standard error.

3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates derived from the survey and of monthly, quarterly and annual movements for South Australia and for each region of South Australia, can be determined by using the table on page 37.

4. The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.

5. As the standard errors in the following table show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most practical purposes. In the tables in this publication estimates with a relative standard error of greater than 25 per cent and percentages based on such estimates, have not been included and have been replaced with an asterisk. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

6. The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is also given in the following table. The estimates of standard errors of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated. Standard errors of quarterly movements can be obtained by multiplying the figures shown in column 1 of the following table by 1.11. Standard errors of all annual movements can be obtained by multiplying the figures shown in column 1 of the following table by 1.3. When using the following table to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

7. Examples of the calculation and use of standard errors are given below:

(a) From column 1 of the following table it can be seen that the estimate of 359,000 employed males in South Australia in November 1986 (see Table 1) has a standard error of approximately 3,300 (by interpolation). There are about two chances in three that the true figure that would have been obtained if all dwellings had been included in the survey would have been within the range 355,700 to 362,300 and about nineteen chances in twenty that it would have been within the range 352,400 to 365,600.

(b) The estimate of movement in the number of employed males in South Australia from October 1986 to November 1986 is an increase of 1,700. Column 3 in the following table can be used to determine the standard error of the monthly movement for the larger of the two estimates from which the movement is derived. In this case, the November 1986 estimate (359,000) is the larger. From column 3 for South Australia, it can be seen that the standard error of the monthly movement is approximately 2,800 (by interpolation). There are about two chances in three that if all dwellings had been included in the surveys the movement would have been in the range -1,100 to +4,500 and about nineteen chances in twenty that it would have been in the range -3,900 to +7,300.

8. It must be remembered that there is no justification for saying that the 'true' estimate is more likely to be at any one point in the range than at any other.

9. The relative standard errors of estimates of average hours worked, average (mean) duration of unemployment, and median duration of unemployment, are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see column 2 in the following table) and then multiplying the figure so obtained by the following relevant factors:

average hours worked: 0.7

average (mean) duration of unemployment: 1.3

median duration of unemployment: 2.0

10. Proportions and percentages (for example, participation rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below:

$$RSE(x/y) = \sqrt{[RSE(x)]^2 + [RSE(y)]^2}.$$

11. Standard errors contained in the following table are designed to provide an average standard error applicable for all monthly labour force survey estimates. Analysis of the standard errors for South Australia applicable to particular survey estimates has shown that the standard errors on estimates of employment are generally equivalent to those shown in the following table, while standard errors for estimates of unemployment and not in the labour force are approximately 5 per cent and 11 per cent higher, respectively, than those shown in the table. Standard errors for estimates classified by country of birth are approximately 10 per cent higher for persons born in Australia. For aggregate estimates of persons born outside Australia the standard errors are approximately the same. The adjustment factor varies for individual countries of birth.

12. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding of data, and errors made in processing the data. Inaccuracies of this kind are referred to as non-sampling errors. They may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce non-sampling errors to a minimum by careful design of questionnaires, intensive training and supervision of interviewers, and efficient operating procedures.

## APPENDIX

COMPARISON OF DATA CLASSIFIED TO THE AUSTRALIAN STANDARD CLASSIFICATION OF OCCUPATIONS (ASCO)  
AND THE CLASSIFICATION AND CLASSIFIED LIST OF INDUSTRIES (CCLO), MAY 1986

1. As from August 1986, occupation data obtained from the Labour Force Survey have been classified according to the Australian Standard Classification of Occupations (ASCO), which has replaced the Classification and Classified List of Occupations (CCLO). A more detailed discussion about the ASCO classification was published in an appendix to the August 1986 issue of this publication (6201.4).

2. To enable a comparison to be made between data classified according to ASCO and data

classified according to CCLO, the responses to questions, on the occupations of employed persons were coded to both classifications for the May 1986 survey. The following matrix table was produced by cross-classifying ASCO Major Groups by CCLO Major Groups. More detailed cross-classifications (by age, sex and Minor Groups) for Australia are available on request. These additional data are not available by State, due to the high sampling variability associated with the usually small size of the estimates involved.

EMPLOYED PERSONS : COMPARISON OF ASCO<sup>(a)</sup> AND CCLO<sup>(b)</sup> CLASSIFICATIONS OF OCCUPATIONS, SOUTH AUSTRALIA, MAY 1986  
(1000)
